The Mineta Transportation Institute at San José State University engages in impactful transportation research and workforce development initiatives to help ensure the efficient movement of people and products, while preparing transportation professionals to lead a more diverse, inclusive, and equitable transportation industry.

Autonomous and automated vehicles, which are both electric and shared—promise to reduce reliance on the personally-owned gasoline-powered car and have the potential to make our cities safer, cleaner, more inclusive, and more sustainable. Yet this vision can only be achieved with policy support at the city, state, and federal levels of government. Local policymakers specifically are uniquely positioned to harness these technological innovations.

Join us to learn how curb use and demand management; parking redesign; asset maintenance; right of way standardization; and cyclist and pedestrian-friendly projects can help cities meet emerging transportation demand more efficiently.
